Climate neutrality

The hydrogen factory of the future

Hydrogen is indispensable to successfully transitioning to renewables and meeting climate targets. It is the essential building block of sector coupling. While it provides an eco-friendly option to meet industry demand for electricity, heat and transportation, this versatile energy source is only eco-friendly when it is sourced from renewables. The Fraunhofer Institute for Factory Operation and Automation IFF has a demand-driven, distributed, modular solution that produces and distributes green hydrogen.

The only way to contain global warming is to slash greenhouse gas emissions on a global scale. Power-to-X technologies are considered a promising means to this end: Electricity sourced from renewables is converted into hydrogen to power fuel cell vehicles, for instance. Researchers at the Fraunhofer IFF in Magdeburg are taking this a step further. They are establishing a design for the distributed and modular production and distribution of green hydrogen for industry, business and transportation throughout the value chain with their hydrogen factory of the future. “Electricity sourced from sun and wind is used to split water into hydrogen and oxygen in a process called electrolysis. The hydrogen is stored and can be converted by fuel cells in vehicles back into electricity that powers them. We primarily have vehicle fleets with vans and forklifts operating in industrial and business parks in mind here,” says Dr. Torsten Birth, a research scientist at Fraunhofer IFF. “We additionally want to supply electricity, gas and heat to industry. The hydrogen produced during electrolysis can be injected into the gas grid, used as fuel, converted into methane or methanol, and made available as industrial feedstock.”

Coupling hydrogen production into a biogas plant

The research scientists are developing modularly expandable subcomponents that can be interconnected and integrated in business and industrial parks, which will enable them to implement their hydrogen factory design. Electrochemical or biochemical processes are used to produce hydrogen, depending on the conditions at the site. “It is not possible to build wind and PV plants everywhere. We are opting for site-specific solutions and using biogas plants for production where possible. Plans for a pilot plant near Gommern in Saxony-Anhalt are on the drawing board. The outcome is always green hydrogen,” the engineer Birth explains.

The Fraunhofer IFF is working together with MicroPro GmbH and Streicher Anlagenbau GmbH & Co. KG in the HyPerFerMent I project to produce renewable hydrogen from...
biomass. They are employing a special microbial fermentation process similar to biogas production to produce hydrogen directly from organic waste. The metabolites of certain bacteria produce a gas mixture containing CO₂ and fifty percent H₂, which can be easily purified by subsequently separating the CO₂. “Fermentative production of green hydrogen will play a major role in distributed production of this energy carrier in the future,” says Birth.

A mobile hydrogen filling station for industrial and commercial parks

Researchers at the Fraunhofer IFF have teamed up with Anleg GmbH to build one of the aforementioned subcomponents, the Mobile Modular H₂ Port (MMH₂P), a portable hydrogen filling station for short trips of up to 200 kilometers. Expandable pressure systems with compressors on a trailer can be refilled and can also dispense hydrogen. The German Federal Ministry of Education and Research and Research (BMBF) is funding the project.

Disinfecting with ozone

Since systemically integrated hydrogen production is important to the researchers, they will not only be using the hydrogen produced during electrolysis but also the oxygen – for welding processes or for ozonation in sewage treatment plants, for instance. Troublesome micropollutants such as pharmaceuticals, pesticides and cosmetics can be removed from wastewater when ozone is introduced. Another use scenario envisions using the oxygen in agriculture to desulfurize biogas plants.

The research team acquired expertise for the implementation of their hydrogen factory in the projects Energieregion Stassfurt 2020 and Energieregion Ostharz. A regional energy plan was implemented in these projects to switch the energy supply in different sectors (power, gas, heat, and transportation) from fossil fuels to regionally produced renewables and renewable sector coupling systems were developed.
The Fraunhofer-Gesellschaft, headquartered in Germany, is the world’s leading applied research organization. With its focus on developing key technologies that are vital for the future and enabling the commercial exploitation of this work by business and industry, Fraunhofer plays a central role in the innovation process. As a pioneer and catalyst for groundbreaking developments and scientific excellence, Fraunhofer helps shape society now and in the future. Founded in 1949, the Fraunhofer-Gesellschaft currently operates 74 institutes and research institutions throughout Germany. The majority of the organization’s 28,000 employees are qualified scientists and engineers, who work with an annual research budget of 2.8 billion euros. Of this sum, 2.3 billion euros is generated through contract research.
